

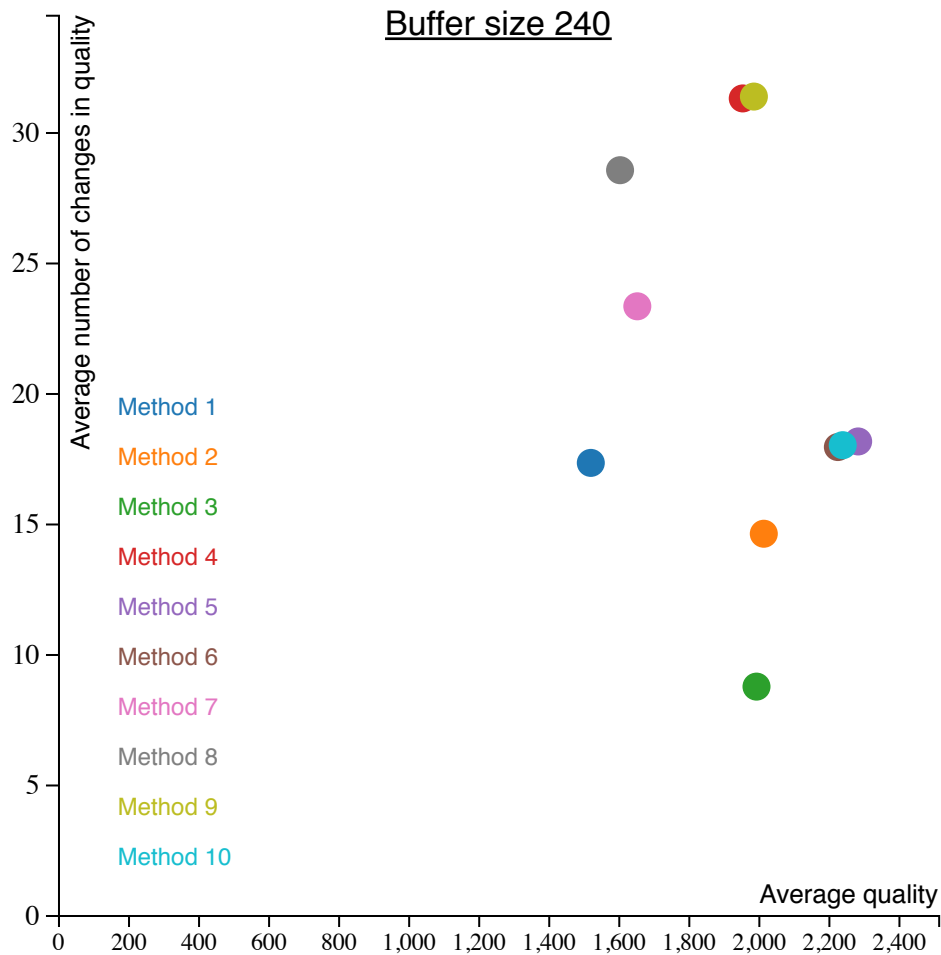

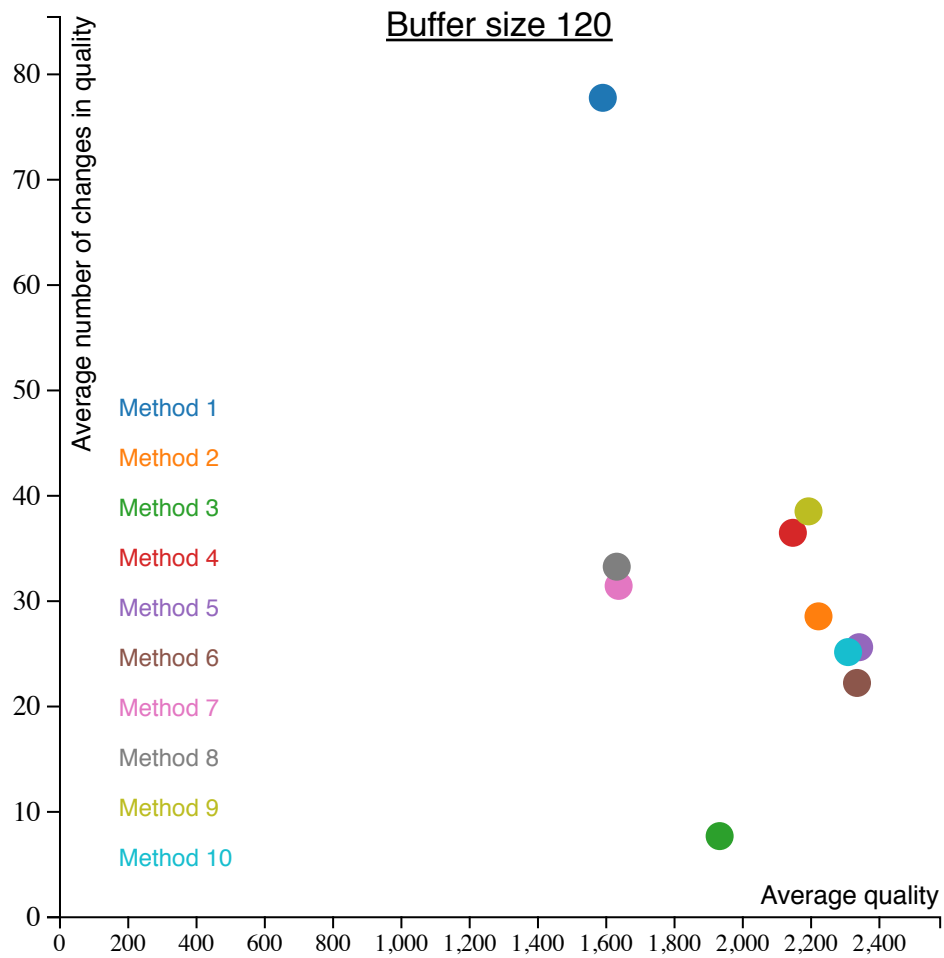

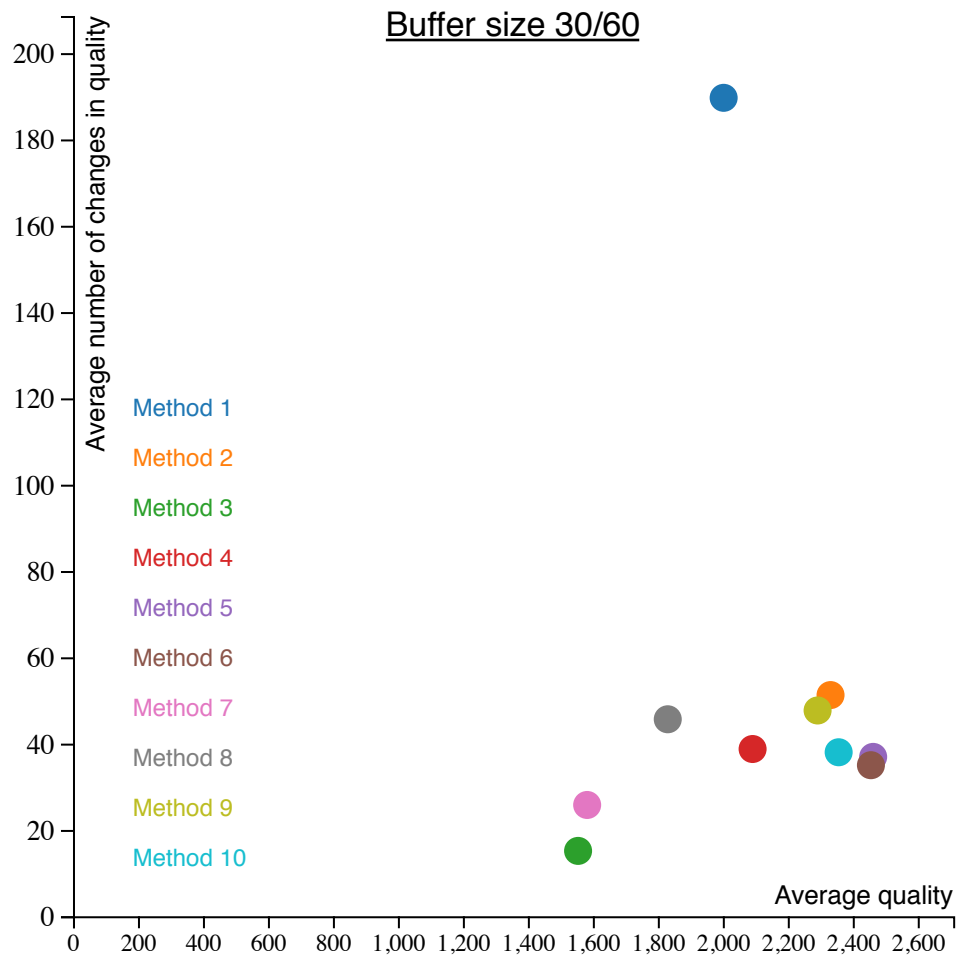

# Graph 1

This graph shows for each buffer configuration the average number of quality changes and the average streaming quality for all given methods.

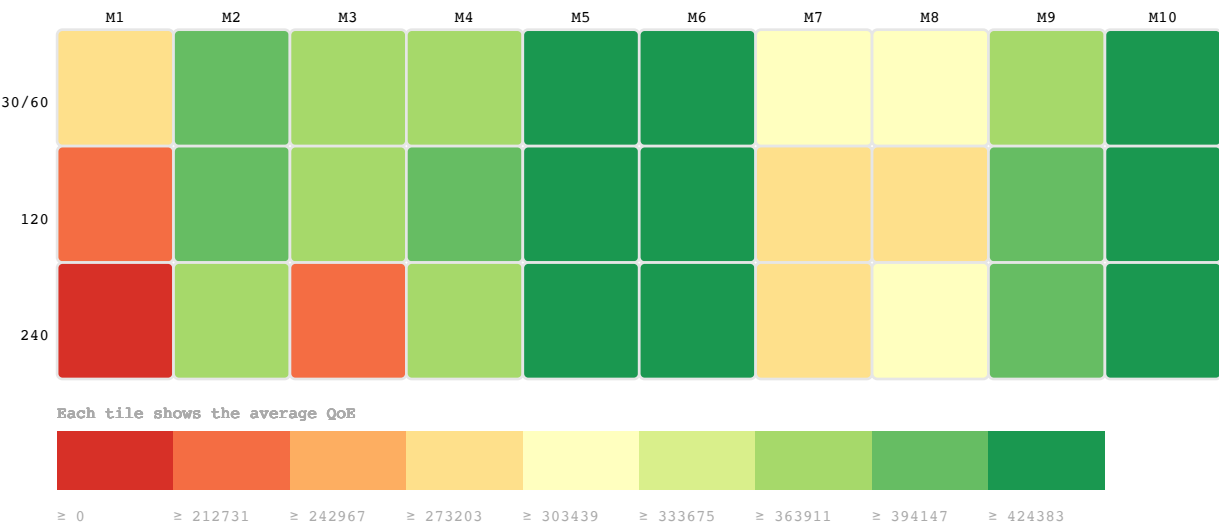

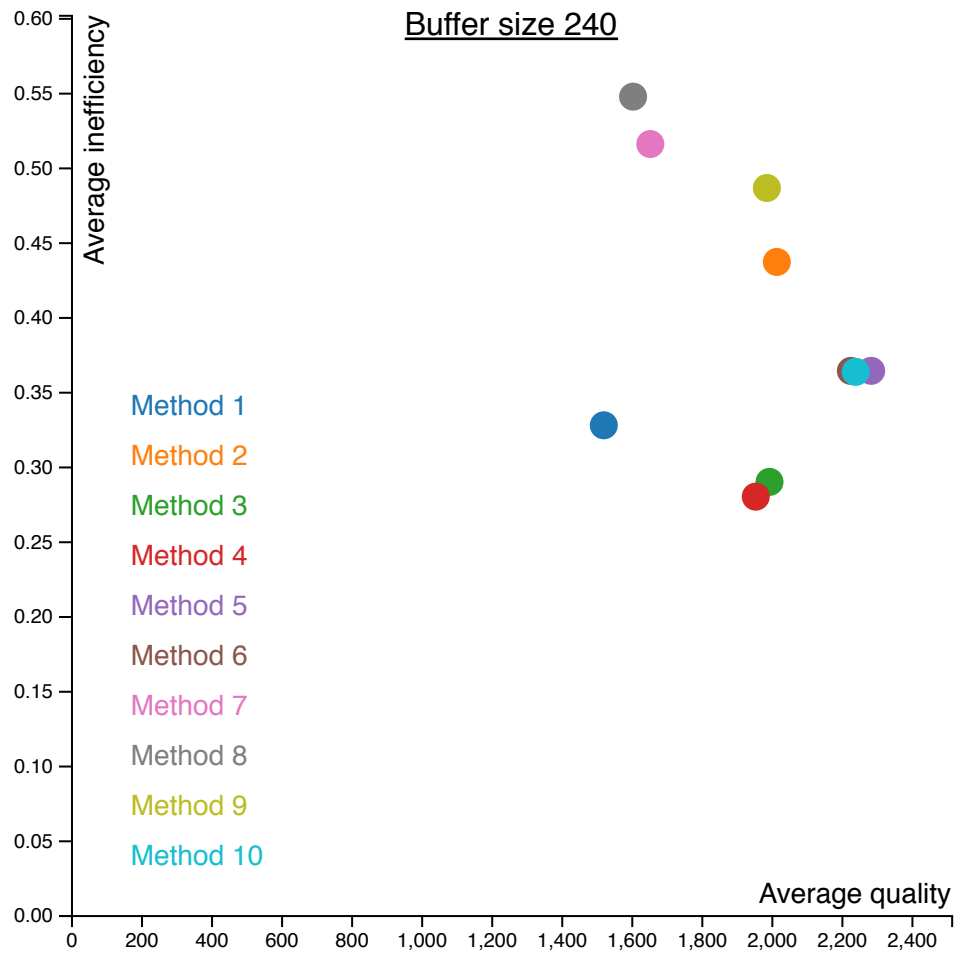

## Graph 2

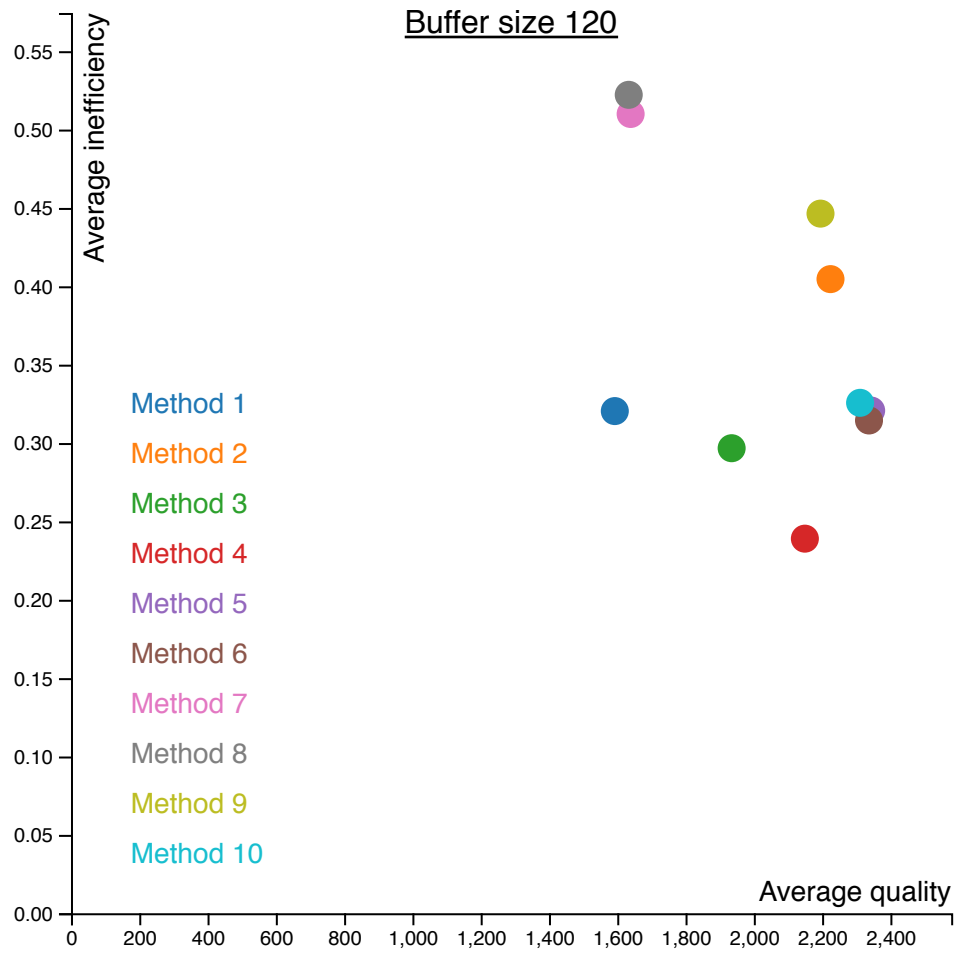

This graph shows for each combination of buffer size and method the average QoE (Quality of Experience) during the playback.

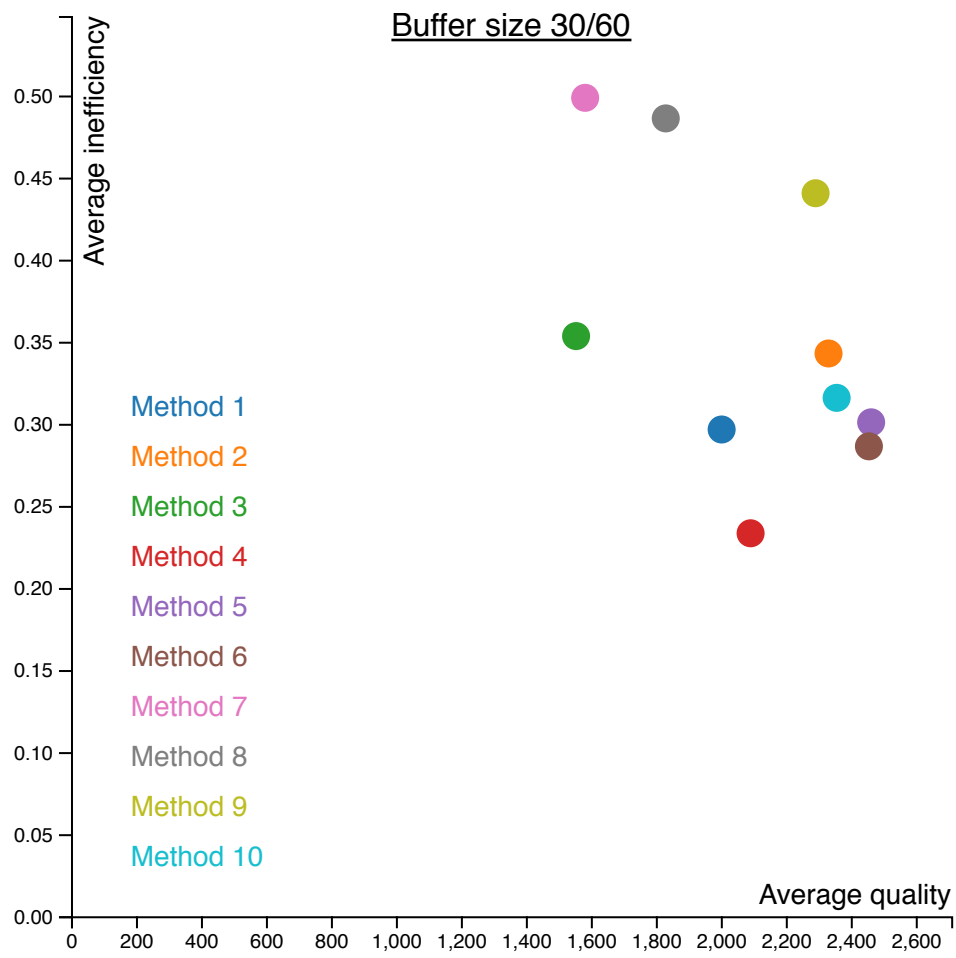

## Graph 3

This graph shows for each buffer configuration the correlation between inefficiency and quality of streaming for all methods.

Graph 4

This graph shows for each network profile configuration the average number of stalls for each method.
